

Technical Note

Title: Responsive University Event Registration Portal Using HTML5 and CSS3

CSS Methods Used:

Inline CSS was used for the university heading color.

Internal CSS was used for the Hero section.

External CSS (style.css) was used for the complete website design because it makes the website easier to maintain and reuse across multiple pages.

CSS Selectors Used:

Universal Selector (*)

Element Selector (body, header)

Class Selector (.card, .hero)

ID Selector (#events, #register)

Descendant Selector (nav a)

Pseudo-class (:hover, :focus)

Pseudo-element (::before)

Layout Method:

Flexbox was used to arrange the event cards in multiple columns on desktop screens and a single column on mobile screens.

Positioning Technique:

Sticky positioning (position: sticky) was used for the navigation header with z-index to keep it visible while scrolling.

Responsive Behaviour:

A media query (@media (max-width:768px)) was used to make the navigation vertical, stack event cards in one column, and adjust the registration form for smaller screens.

Event Card Width Calculation

Card CSS

width:270px;

padding:20px;

border:2px solid;

margin:10px;

Default Content Box Model

Content Width = 270 px

Left Padding = 20 px

Right Padding = 20 px

Left Border = 2 px

Right Border = 2 px

Total Horizontal Width = $270 + 20 + 20 + 2 + 2 = 314$ px

When box-sizing: border-box is applied, the total width remains 270 px because the padding and border are included within the specified width.
